

LUXWELD

Warranty backup — setup guide

This is your one-time setup for the LUXWELD warranty backups. When it's done, every warranty record (all photos + details) is copied automatically to your Google Drive and to a physical hard drive — with nothing to remember day to day. Work through it top to bottom.

Can I do this now?

You can start **Step 1 today, from your own computer** (a laptop/desktop is much easier than a phone for this one). Step 2 needs Flynn to plug in your two codes first, so the order is: **you do Step 1 → send Flynn the two codes → Flynn confirms → you do Step 2.**

If you get stuck

If any screen looks different from this guide (Google changes their layout sometimes), don't guess — take a screenshot and send it to Flynn. Nothing here can break the website.

Step 1 — Create the Google connection

About 15 minutes, one time. This is the only technical part — it creates the secure link that lets the website save into your Google Drive.

Part A — Create a project

1. Go to **console.cloud.google.com** and sign in with the LUXWELD Google account.
2. If it asks about terms of service, tick agree and continue.
3. At the very top, click the **project dropdown** (may say “Select a project”) → **New Project** (top right).
4. **Name:** type **LUXWELD Warranty**. Leave the rest as-is. Click **Create**.
5. Wait a few seconds, then make sure the top dropdown shows **LUXWELD Warranty** (select it if not).

Part B — Turn on Google Drive

1. In the search bar at the top, type **Google Drive API** and press Enter.
2. Click the result **Google Drive API**.
3. Click the blue **Enable** button and wait for it to finish.

Part C — Set up and PUBLISH the consent screen

This is the part people miss — do all 5 steps, especially step 5.

1. In the top search bar, type **OAuth consent screen** and open it. (On newer layouts it's under **Google Auth Platform** → **Branding / Audience**.)
2. If asked **User Type**, choose **External**, then **Create**.
3. Fill only the required fields (red star): **App name** = **LUXWELD Warranty**; **User support email** = pick your email; **Developer contact** = your email again. Click **Save and Continue** through the next pages (nothing to add).
4. Find the **Audience** (or **Publishing status**) page.
5. Under **Publishing status** it likely says **Testing**. Click **Publish app** → **Confirm**. It should now say **In production**. ← the important one.

Don't skip step 5

If you skip "Publish", the backup will quietly stop working after 7 days.

Part D — Create the connection (OAuth client)

1. In the top search bar, type **Credentials** and open it (**APIs & Services** → **Credentials**).
2. Click **+ Create Credentials** → **OAuth client ID**.
3. **Application type**: choose **Web application**.
4. **Name**: **LUXWELD Warranty website** (any name is fine).
5. Scroll to **Authorised redirect URIs** → click **+ Add URI** and paste this exactly:

```
https://warranty.luxweld.com.au/admin/drive/callback
```

Then click **+ Add URI** once more and paste this second one too (for future Google login):

```
https://warranty.luxweld.com.au/auth/google/callback
```

Then click **Create**.

Part E — Copy the two codes and send them to Flynn

A window titled "**OAuth client created**" appears with:

1. **Client ID** — a long code ending in `.apps.googleusercontent.com`
2. **Client secret** — a shorter code starting with something like `GOCSPX-`

Copy **both** (there are copy buttons) and **send them to Flynn** like you would a password — don't post them publicly. If the window closed, reopen it from **Credentials** → click your client name → the codes are on the right.

You know Step 1 is done when

Flynn confirms your two codes are in, and the **Google Drive** box on the Archive page changes from "Not set up" to a **Connect Google Drive** button.

Step 2 — Turn on the automatic backup

About 2 minutes. Do this after Flynn confirms Step 1.

1. Go to **warranty.luxweld.com.au** and log in (email **jono@luxweld.com.au**; if unsure of the password, ask Flynn to reset it).
2. Click **Archive** in the top menu.
3. Find the **Google Drive backup** box near the top and click **Connect Google Drive**.
4. Sign in with **your** Google account and click **Allow / Continue**.
5. You'll return to the Archive page and it will say the first backup is uploading.

You know it worked when

Open Google Drive (drive.google.com) — within a few minutes a folder called “**LUXWELD Warranty Archive**” fills up, one folder per flashing.

Finding a record later: in Google Drive, just type into the search bar — a serial number, an installer's name, a site, or a date — and the matching folder appears with all its photos and details inside.

Step 3 — Keep the website switched on (with Flynn)

The site currently runs on a free trial that can switch it off. Upgrading keeps it on 24/7. Flynn will sit with you — it's a 2-minute payment step and needs your card / your call on the plan, so it's the one thing that can't be done ahead of time.

You know it worked when

The plan no longer says “Trial”, and the “shut down” emails stop.

Step 4 — Set up the always-on backup computer + hard drive

About 10 minutes. This is your physical copy: a computer left on that mirrors everything from your Google Drive down onto the big external drive.

On the computer you'll leave running (with the 10 TB drive plugged in):

1. Plug in the external hard drive.
2. Go to **google.com/drive/download** and install **Google Drive for desktop**.
3. Open it and **sign in with the same Google account** your backups go to.
4. Click the **gear (Settings)** → **Preferences** → **Google Drive**, and choose **Mirror files** (keeps a real full copy on the drive, not just links).
5. When asked where to keep the files (or under **Advanced settings**), pick the **external hard drive** (e.g. E:\LUXWELD Backup). This same menu is where you'd change the destination later.
6. Let it finish the first copy, then open the drive and check the **LUXWELD Warranty Archive** folder is really there with photos inside.

Important

Keep this computer switched on (turn off “sleep” in the power settings). If it's ever off for a while it's fine — it catches up as soon as it's back on.

Step 5 (optional) — A stronger password

Your admin login opens everything, so a longer password is much safer than a short number. To change it: log in → **Users** (top menu) → on your own account, set a new password (a short phrase plus a number and symbol is ideal).

That's it

Once Steps 1, 2 and 4 are done, your warranty data lives in **three** places at once — the live website, your Google Drive, and your physical hard drive — all kept up to date automatically.
